

**TABLE 2. Clinical and Laboratory Findings in Kounis Syndrome**

<b>Clinical symptoms</b>	<b>Clinical signs</b>	<b>Electrocardiographic signs</b>	<b>Laboratory signs</b>
Acute chest pain Chest discomfort while swallowing Dyspnea Faintness Headache Malaise Nausea Pruritus Skin itching Syncope Vomiting	Bradycardia Cardiorespiratory arrest Cold extremities Diaphoresis Hypotension Pallor Palpitations Skin rash Sudden death Sweating Tachycardia	Atrial fibrillation Bigeminal rhythm Heart block Nodal rhythm Sinus bradycardia Sinus tachycardia ST segment depression or elevation T-wave flattening and/or inversion QRS complex prolongation QT segment prolongation Ventricular ectopics Ventricular fibrillation	Coronary angiography (spasm, thrombosis) Eosinophilia Increased cardiac enzymes-especially CPK-MB Increased troponins Cardiomegaly in the chest X-ray Dilated cardiac chambers in echogram Eosinophils, and/or mast cells in coronary biopsy MRI: subendocardial gadolinium concentration Thallium-201 (SPECT) single-photon emission computer tomography and 125I-15-(p-iodophenyl)-3-(R,S) methylpentadecanoic acid (BMIPP) SPECT detects ischemia
